Incident Summary — Suspicious Authentication Activity

Suspicious Authentication Activity

Finding: Multiple failed authentication attempts (Event ID 4625) from 192.168.56.102 were followed by successful authentication events (Event ID 4624), including activity involving the john account.

Investigation: The authentication timeline was correlated in Splunk using timestamp, source IP, username, and logon type. The sequence showed unsuccessful authentication followed by successful authentication from the same source.

Assessment: The pattern was investigated as suspicious authentication activity. The events were generated as part of a controlled SOC lab simulation and do not represent confirmed compromise.

Account Activity by Event Type

Incident Finding — Account Manipulation & Privilege Escalation

Account Manipulation & Privilege Escalation

Finding: Suspicious account activity was identified involving the soc.audit account. The account was created and added to the privileged IT-Admins group, followed by account modification, privilege removal, disable/enable activity, password reset, and eventual deletion.

Investigation: The sequence is consistent with an attempt to manipulate an Active Directory account and obtain or maintain privileged access. The primary account involved was soc.audit.

Incident Finding — Network Threat Blocking

Network Threat Blocking

Finding: Repeated ICMP traffic from 192.168.56.102 to DC01 192.168.56.101 was blocked by the Windows Firewall.

Investigation: Firewall events were correlated using source IP, destination IP, protocol, and timestamp. Multiple DROP events confirmed repeated blocked network traffic against DC01.
